

Negatives, Simplification

If one of the numerator or denominator is negative, then the fraction is negative.

$$\frac{-2}{3} = \frac{2}{-3} = -\frac{2}{3}$$

What if both denominator and numerator are negative?

Fractions are simplified by putting them in lowest terms:

$$\frac{12}{20} = \frac{6}{10} = \frac{3}{5}$$

Was there a quicker way to simplify this fraction?
